

WORKMASTER® Model TIV-060 Pneumatic Timer is a uniquely rugged and simple "Set-It-Forget-It" compressed air-operated Timer for areas where electrical current is undesirable or dangerous. The Timer features a high-flow poppet valve with spring return. It enables the User to decide how much time will pass before the piston opens the chamber to allow air to flow to the Vibrator or other driven device. This type of control mechanism enables precise event-timing without relying on electrical timing devices. The Timer's main valve has three ports permanently marked: Inlet (1/2" NPT), Outlet (1/2" NPT) and Exhaust (3/4" NPT). The Timer works on 30 PSI to 120 PSI and has a  $\pm 5\%$  Repeatability.
